

Brew day sheet- Belgian Blonde Ale 23 Litre

This brew day sheet provides instructions which are specific to your recipe pack. Points in this Brew day sheet which are numbered and marked in **bold** are further explained in the brewing guide.

Mashing

Mix the crushed grain into heated water.

	Recommended	Actual	Record Mash Time
1. Strike Water volume: The starting amount of heated water. A= Grainfather /Bulldog all in one brewing system. B = Single pot vessel	A: 22 Litres B: 20 Litres		Started:
2. Strike water temperature: The Ideal temperature of the heated water prior to mixing in the grain.	76°C		Finished:
3. Mashing temperature: Temperature of the 'mash' after grain is mixed in.	66°C		Total:

Maintain the mash temperature for 1 hour.

Sparging

Sparging rinses the remaining sugars off the mashed grains using heated water, and brings your wort up to a pre-boil volume.

	Recommended	Actual
4. Sparge Water volume: The recommended amount of hot water to be prepared for rinsing (sparging) the grains. NOTE this is a recommendation, more or less may be required in order to collect the pre-boil wort volume, indicated at 6.	8 - 12 litres	
5. Sparge water temperature: The temperature of the heated sparge water.	76°C	
6. Pre-boil wort volume: Total target volume of wort to be collected in the boiler. NOTE this is general recommendation which may vary.	28 Litres	

Boiling

Bring the heat back up to the boil and maintain a rolling boil while adding the hop additions as below.

	Recommended	Actual
7. Boil Length: Length of time the wort is boiled for.	60 minutes	

Hop Additions

Weigh out hops from your labelled hop packets according to the recommended weights. Add these hops to the boiling wort at the recommended time intervals from the start of the boil to provide bitterness, aroma, and flavour.

8. Hop Pack	Weight	Recommended boil time	Time added
A	46g	60 minutes	

Cooling

Rapidly chill the wort by placing the pot in a sink of iced water, or use a 'wort chiller'. Cool the wort to 18-23°C and transfer it to a **sanitised** fermentation vessel.

Fermentation

Once wort is collected in a **sanitised** fermenter check the temperature is between (18-23 °C) and record a hydrometer reading. If your hydrometer reading is higher than the recommended original gravity, you can adjust this to match the recipe by adding water. Pitch the yeast, seal the fermenter and add an airlock or blow off tube. Allow it to ferment at 18-23°C for 7 to 10 days or until fermentation looks complete and is confirmed with stable hydrometer readings over a 24 hour period (see below).

Targets

	Desired	Actual
1. Volume Collected (Volume in the fermentation vessel)	23 Litres	
2. Original Gravity (Hydrometer reading before adding yeast)	1.058	
3. Finishing Gravity (Hydrometer reading after fermentation)	1.009	
4. Calculate the ABV	6.5%	

Bottling and Priming

Use your hydrometer to check fermentation has finished. Two consecutive readings 24 hours apart with no movement in readings will confirm your beer has finished fermenting. Carefully siphon the beer off the sediment directly into bottles, keg, barrel or secondary bottling vessel.

	Recommended	Amount used
1. Bulk priming sugar	115g	
2. OR sugar per 500 ml bottle	2g (<half teaspoon)	

After bottling, kegging, or putting in a barrel, store at room temperature for 10 days to carbonate. Condition at room temperature or cooler (4-23 °C) for another 3 weeks before drinking.

Customisation options

Belgian blonde ales are a great base for flavour additions. Here are a few examples:

Description	What to add (per gallon)	When to add
Belgian Golden Strong Ale – Get that classic Duvel flavour.	Add 250g sugar per gallon and substitute yeast with WLP570 Belgian Golden Ale.	Add sugar at 5 minutes to the end of the boil.
Hibiscus Belgian pink ale – Hibiscus will add deep pinkish tones, berry flavour and a subtle tartness to this already refreshing style.	Add 30g hibiscus per gallon.	Add at 5 minutes to the end of the boil.
Orval clone – This beer will gain additional complexity over time.	Add WLP650 Brett Bruxellensis or Orval bottle dregs (last inch of liquid from a settled bottle).	Add just at bottling time. You can even pipette single drop in each bottle before capping. Warning: This beer will slowly gain additional carbonation.
